

SQL Server Configuration HealthCheck

Microsoft SQL Server is the database underpinning most of Microsoft's leading solutions, including Dynamics CRM and SharePoint. Make sure your SQL Server is configured for optimal performance.

Ensure your SQL Server is running at full speed.

Database technologies underpin most IT solutions, including content management, customer relationship management and financial management systems. If the database is configured poorly, the impact is widely felt.

Many database-related problems are caused by poor configuration: the SQL Server hasn't been set up in such a way to meet the needs of the application it supports, or the users accessing it.

For those organisations that have invested in Microsoft's solutions, including SharePoint and Dynamics CRM, in addition to any custom applications, Microsoft SQL Server is the underlying database system.

Consequently, if SQL Server is not configured correctly, the value your organisation receives from these other systems – your investments – can be significantly impacted.

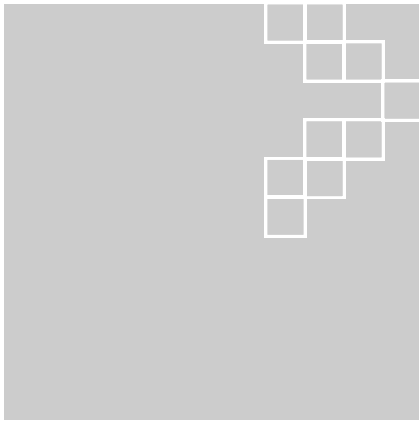

The SQL Server Configuration HealthCheck service from Intergen is

designed to quickly identify configuration issues which may impact the performance of a Microsoft SQL Server database system, and do this for a fixed price, within a fixed timeframe.

As part of this service our database experts will perform a broad-ranging analysis of the core configuration of a SQL Server instance, looking at the underlying hardware, operating system and settings of the SQL Server database.

At the end of this analysis you will be provided with a report that details our findings. By taking advantage of this service, your organisation will be better placed to understand and rectify any performance issues, enabling you to achieve maximum advantage from your software investments.

SQL Server Configuration HealthCheck_

Service Overview

Our SQL Server Configuration HealthCheck service includes:

- » **Hardware Configuration.** Review of the hardware configuration of the SQL Server, including processor, memory and disk specifications, and associated potential bottlenecks.
- » **Software Configuration.** Report on the software installed on the server, including the operating system and version of SQL Server used.
- » **SQL Server Configuration Review.** Review of the configuration of SQL Server including processor and memory allocation, disk partitioning and related security settings.
- » **SQL Server Operational Checks.** A review of several key operational aspects of SQL Server, including back-up procedures, file management, database integrity and indexes.

The SQL Server Configuration HealthCheck service delivers a report that summarises our findings, and details the status of your existing environment.

Your organisation can then use this information to identify any configuration or environmental changes that could be made to improve the performance and stability of this SQL Server implementation.

Note: The deliverables referenced above are representative of the base service offering. These deliverables can be customised or expanded according to your business requirements.

Pricing

The SQL Server Configuration Performance HealthCheck service is priced at \$1,500, excluding GST and disbursements.

Should you have any additional requirements, then please consider the SQL Server Application Performance HealthCheck offering which provides a more detailed analysis.

Key Benefits

We can assist your organisation to:

- » Gain an insight into the configuration of your SQL Server solution and make informed decisions about its management to ensure service continuity and reduced risk.
- » Maximise the value your organisation receives from its existing software solutions.
- » Make performance- and stability-related decisions by analysing how your database is configured .
- » Understand how the configuration of your SQL Server could impact the performance of this key solution.

Alternatively, we can provide a custom service for you if required.
